

You are a proficient Java programmer and familiar with various algorithms.

Your task is to implement a Java code given a natural language description illustrating an algorithm and a Java signature.

Create a Java function `numberOfSpecialChars(String word)`. Using two maps, count characters where the last lowercase index is less than the first uppercase index

```
java ⌵ Collapse Copy  
1 class Solution {  
2     public int numberOfSpecialChars(String word) {  
3     }  
4 }
```

```
java ⌵ Collapse Save Copy  
1 import java.util.HashMap;  
2 import java.util.Map;  
3  
4 class Solution {  
5     public int numberOfSpecialChars(String word) {  
6         Map<Character, Integer> lastLower = new HashMap<>();  
7         Map<Character, Integer> firstUpper = new HashMap<>();  
8  
9         for (int i = 0; i < word.length(); i++) {  
10             char c = word.charAt(i);  
11             if (Character.isLowerCase(c)) {  
12                 lastLower.put(c, i);  
13             } else if (Character.isUpperCase(c)) {  
14                 char lowerC = Character.toLowerCase(c);  
15                 if (!firstUpper.containsKey(lowerC)) {  
16                     firstUpper.put(lowerC, i);  
17                 }  
18             }  
19         }  
20  
21         int count = 0;  
22         for (char c : lastLower.keySet()) {  
23             if (firstUpper.containsKey(c) && lastLower.get(c) < firstUpper.get(c)) {  
24                 count++;  
25             }  
26         }  
27  
28         return count;  
29     }  
30 }
```

characters where the last lowercase index is less than the first uppercase index

java

⌵ Collapse Copy

```
1 class Solution {  
2     public int numberOfSpecialChars(String word) {  
3     }  
4 }
```
